The fungal-type α -glucosidase from *Neurospora crassa* is a cellobiose- and trehalose-hydrolyzing enzyme belonging to the GH3 family. Cys715 was identified as a catalytic nucleophile in the active site of the enzyme. Cys715 was replaced by Ala, Ser, Asn, Gln, and Thr. The catalytic efficiency of the mutants was determined with respect to the turnover number (*k*_{cat}) and Michaelis constant (*K*_m). For the Cys715Ser and Cys715Asn mutants, the *k*_{cat} values increased by 2.4- and 2.6-fold, respectively. The mutants with a threonine residue at position 715 (Cys715Thr) showed no increase in the *k*_{cat} value, but exhibited a decrease in the *K*_m value. The Cys715Glu mutant had the same 82157476af
